

A PRELIMINARY PROJECT REPORT ON  
**“Music Recommendation System Based on  
Face Recognition Technology”**

SUBMITTED IN THE PARTIAL FULFILLMENT OF THE REQUIREMENTS  
FOR THE AWARD OF THE DEGREE  
OF

BACHELOR OF COMPUTER ENGINEERING

Submitted By

Aditya Deshmukh

Exam no: B190704201

Ganesh Adsul

Exam no: B190704202

Nikhil Hade

Exam no: B190704222

Kiran Talekar

Exam no: B190704258

Under the Guidance of

**Prof. Iqra Shaikh**

DEPARTMENT OF COMPUTER ENGINEERING  
ALARD COLLEGE OF ENGINEERING AND MANAGEMENT, MARUNJI, PUNE

SAVITRIBAI PHULE PUNE UNIVERSITY

2023-2024

## CERTIFICATE

This is to certify that the project report entitles.

### **“Music Recommendation System Based on Face Recognition Technology”**

Submitted by:

Aditya Deshmukh

Exam no: B190704201

Exam no: B190704258

are Bonafede students at this institute and the work has been carried out by them under the supervision of Prof. Iqra Shaikh and it is approved for the partial fulfillment of the requirement of Savitribai Phule Pune University, for the award of the degree of Bachelor of Engineering (Computer Engineering).

**Prof. Iqra Shaikh**

Project Guide  
Dept. of Computer Engg.

**Prof. Sayli Haldavanekar**

Head of Dept.  
Dept. of Computer Engg.

**Prof. \_\_\_\_\_**

External Examiner,  
SPPU

**Dr. K.D Sapate**

Principal,  
Alard College of Engg. and Mngmt

Place: Pune.

Date: 10 November 2023.

## ACKNOWLEDGEMENT

We take this opportunity to express our profound gratitude and deep regards to my guide **Prof. Iqra Shaikh** for her exemplary guidance, monitoring, and constant encouragement throughout the completion of this report. I am truly grateful for her efforts to improve my technical writing skills. The blessing, help and guidance given by her from time to time shall carry me a long way in the journey of life on which I am about to embark. I take this privilege to express my sincere thanks to **Prof. Sayli Haldavanekar**, Head of the Department of Computer Engineering, for her generous support.

Last but not least I would also like to thank all those who have directly or indirectly helped me with the completion of this report.

I would also thank my Institution and my faculty members without whom this project would have been a distant reality.

Adtiya Deshmukh  
Ganesh Adsul  
Nikhil Hade  
Kiran Talekar  
(B.E. Computer Engg.)

## **ABSTRACT**

Music plays a significant role in improving and elevating one's mood as it is one of the important sources of entertainment and inspiration to move forward. Recent studies have shown that humans respond as well as react to music in a very positive manner and that music has a high impact on human brain activity. Now a days, people often prefer to listen to music based on their moods and interests. This work focuses on a system that suggests songs to the users, based on their state of mind. In this system, computer vision components are used to determine the user's emotion through facial expressions.

Once the emotion is recognized, the system suggests a song for that emotion, saving a lot of time for a user over selecting and playing songs manually. The conventional method of playing music depending upon the mood of a person requires human interaction. Migrating to computer vision technology will enable automation of such a system. To achieve this goal, an algorithm is used to classify human expressions and play a music track according to the present emotion detected. It reduces the effort and time required in manually searching a song from the list based on the present state of mind of a person. The expressions of a person are detected by extracting the facial features using the Haar Cascade algorithm and CNN Algorithm. An inbuilt camera is used to capture the facial expressions of a person which reduces the designing cost of the system as compared to other methods.

## **CHAPTER 1 INTRODUCTION**

## 1.1 Overview

Facial expressions are one of the natural means to communicate the emotions and these emotions can be used in entertainment and Human Machine Interface (HMI) fields in today's world, with the advancements in the areas of technology various music players are deployed with features like reversing the media, fast forwarding it, streaming playback with multicast streams. Although these features satisfy the basic requirements of the user, one must manually surf for the song from a large set of songs, according to the current circumstance and mood. This is a time-consuming task that needs some effort and patience. The main objective of this work is to develop an intelligent system that can easily recognize facial expressions and accordingly play a music track based on that expression/emotion recognized.

The seven universally classified emotions are Happy, Sad, Anger, Disgust, Fear, Surprise and Neutral. The main objective of this work is to develop an intelligent system that can easily recognize facial expressions and accordingly play a music track based on that expression/emotion recognized. The seven universally classified emotions are Happy, Sad, Anger, Disgust, Fear, Surprise and Neutral. The algorithm that is used in developing the present system is the Haar Cascade algorithm which utilizes eigenfaces to extract facial features.

The designed algorithm is very efficient due to less computational time taken, hereby increasing the performance of the system. This work finds its applications in various domains like Human Computer Interaction (HCI), therapeutic approach in health care etc. Most of the time digital music is sorted and put together based on attributes such as artist, genre, albums, language, popularity and so on.

Many of the available online music streaming services recommend music based on user's preferences and his previous music listening history that employ content based and collaborative filtering recommendations. But these recommendations may not suit the current mood of the user. The manual classification of songs by learning user's preference of emotion is a time-consuming task. So, recommendations can also be achieved using the physiological and emotional status of the user which are mainly captured from the user's facial expression, gestures, pulse rate, movement, speech/text interactions etc.

Several works is carried out to detect emotions using facial landmarks to extract the features. Nguyen et al. detected three kinds of emotions namely positive, negative and blank using 68 facial landmarks. This system work proposes a CNN based approach to recommend music by analyzing the multimodal emotional information captured by facial movements and semantic analysis of the speech/text interactions of the user, thus, intensifying the decision of the system on recognized emotions in real-time. Machine learning has become very popular in recent years.

Depending on the type of application and the dataset available, certain types of machine learning techniques are more appropriate than others for different applications. The main types of learning algorithms include supervised learning, unsupervised learning, semi-supervised learning, and reinforcement learning. A neural network (NN) is a technique of machine learning that is generally effective at extracting critical features from complex datasets and deriving a function or model that expresses those features. The NN utilizes a training dataset to first train a model. After the model is trained, the NN can then be applied to new or previously unseen data-points and classify the data based on the previously trained model

## 1.2 MOTIVATION

- Our effort is an initial step to bridge the gap between the traditional music browsing system and the users’ needs.
- This work proposes a CNN based approach to recommend music by analyzing the multimodal emotional information captured by facial movements and semantic analysis of the speech/text interactions of the user, thus, intensifying the decision of the system on recognized emotions in real-time.

## 1.3 PROBLEM STATEMENT

- To implement an application that provides evacuation route guidance and indoor navigation system by using Augmented Reality. This will help users to easily navigate through the buildings, companies, offices, college, etc. to reach 3 their respective location by using the path provided by the application and also in case of indoor fire environment it will provide the safe path to the users to get out from that place. the application should be able to fetch and play .mp3 and. Wav Files. The ability to support different types of service level music.

## 1.4 OBJECTIVE

- The main objective of this work is to develop an intelligent system that can easily recognize facial expressions and accordingly play a music track based on that expression/emotion recognized.
- The underlying objective of this paper is to design an accurate algorithm that would yield a list of songs from a user’s playlist in conformance with a user’s emotional state.
- The algorithm design requires less computational time, storage and reduces the cost incurred in employing additional hardware. It categorizes a facial image under 4 different facial expressions viz. Sad, Anger, Neutral and Happiness. The overall process is illustrated.

## **CHAPTER 2 LITERATURE SURVEY**

## 2.1 STUDY OF RESEARCH PAPER

**1.Paper Name:** Research on Automatic Music Recommendation Algorithm Based on Facial Micro-expression Recognition.

**Author:** Ziyang Yu<sup>1</sup> , Mengda Zhao<sup>1</sup> , Yilin Wu<sup>1</sup>, Peizhuo Liu<sup>1</sup> , Hexu Chen<sup>1</sup>

**Description:** In recent years, with the development and application of big data, deep learning has received more and more attention. As a deep learning neural network, convolutional neural network plays an extremely important role in face image recognition. In this paper, a combination of micro-expression recognition technology of convolutional neural network and automatic music recommendation algorithm is developed to identify a model that recognizes facial micro-expressions and recommends music according to corresponding mood. The facial micro-expression recognition model established in this paper uses FER2013 with a recognition rate of 62.1content-based music recommendation algorithm is used to extract the feature vector of the song and a cosine similarity algorithm is used to make the music recommendation. This research helps to improve the practicality of the music recommendation system, and the related results will also serve as a reference for the application of the music recommendation system in areas such as emotion regulation

**2.Paper Name:** EMOSIC- An Emotion Based Music Player for Android.

**Author:** Karthik Subramanian Nathan , Manasi Arun and Megala S Kannan

**Description:** Music plays a very important role in human's daily life and in the modern advanced technologies. Usually, the user has to face the task of manually browsing through the playlist of songs to select. Here we are proposing an efficient and accurate model, that would generate a playlist based on current emotional state and behavior of the user. Existing methods for automating the playlist generation process are computationally slow, less accurate and sometimes even require use of additional hardware like EEG or sensors. Speech is the most ancient and natural way of expressing feelings, emotions and mood and its processing requires high computational, time, and cost. This proposed system is based on real-time extraction of facial expressions as well as extracting audio features from songs to classify into a specific emotion that will generate a playlist automatically such that the computation cost is relatively low.

**3.Paper Name:** Emotion aware Smart Music Recommender System using Two Level CNN.

**Author:** Krupa K S, Ambara G

**Description:** Music plays a significant role in improving and elevating one’s mood as it is one of the important source of entertainment and inspiration to move forward. Recent studies have shown that humans respond as well as react to music in a very positive manner and that music has a high impact on human’s brain activity. Nowadays, people often prefer to listen to music based on their moods and interests. This work focuses on a system that suggests songs to the users, based on their state of mind. In this system, computer vision components are used to determine the user’s emotion through facial expressions and chatbot interactions. Once the emotion is recognized, saving a lot of time for a user over selecting and playing songs manual.

## **CHAPTER 3 REQUIREMENTS SPECIFICATIONS**

### 3.1 Hardware Requirements

- Hardware: intel core
- Speed: 2.80 GHz
- RAM: 8GB
- Hard Disk: 500 GB
- Keyboard: Standard Windows Keyboard

### 3.2 Software Requirements

- Operating System: Windows 10(64 Bit)
- IDE: Spyder
- Programming Language: python version 3.7,3.8

### 3.3 FUNCTIONAL REQUIREMENTS

- Proposed system consists of 4 modules:
  - a) Feature point extraction: Feature points of each image gets detected.
  - b) Feature correspondence matching: Matching of selected feature points across various image frames.
  - c) Point estimation: Position estimation and vision system orientation during navigation.
  - d) Position refinement: Location estimate based, accurate location derivati

### 3.4 Non-Functional Requirements

#### 3.4.1 Performance Requirements

- The performance of the functions and every module must be well. The overall performance of the software will enable the users to work recently. Performance of encryption of data should be fast.
- Performance of the providing virtual environment should be fast Safety Requirement The application is designed in modules where errors can be detected. This makes it easier to install and update new functionality if required.

#### 3.4.2 Safety Requirements

- The application is designed in modules where errors can be detected and fixed easily. This makes it easier to install and update new functionality if required.

#### 3.4.3 Software Quality Attributes

- Our software has many quality attribute that are given below: -
- Adaptability: This software is adaptable by all users.
- Availability: This software is freely available to all users. The availability of the software is easy for everyone.
- Maintainability: After the deployment of the project if any error occurs then it can be easily maintained by the software developer.
- Reliability: The performance of the software is better which will increase the reliability of the Software.
- User Friendliness: Since, the software is a GUI application; the output generated is much user friendly in its behavior.
- Integrity: Integrity refers to the extent to which access to software or data by unauthorized persons can be controlled.
- Security: Users are authenticated using many security phases so reliable security is provided.
- Testability: The software will be tested considering all the aspects.

### 3.5 SYSTEM REQUIREMENTS

- 100GB HDD (minimum)
- Intel 1.66 GHz Processor Pentium 4 (minimum)
- Internet Connectivity
- 2GB RAM (minimum).

## **CHAPTER 4 SYSTEM DESIGN**

## 4.1 SYSTEM ARCHITECTURE

1. Image Acquisition In any of the image processing techniques, the first task is to acquire the image from the source. These images can be acquired either through camera or through standard datasets that are available online. The images should be in .jpg format. The images considered here are user dependent i.e., dynamic images. The number of sample training images considered here.

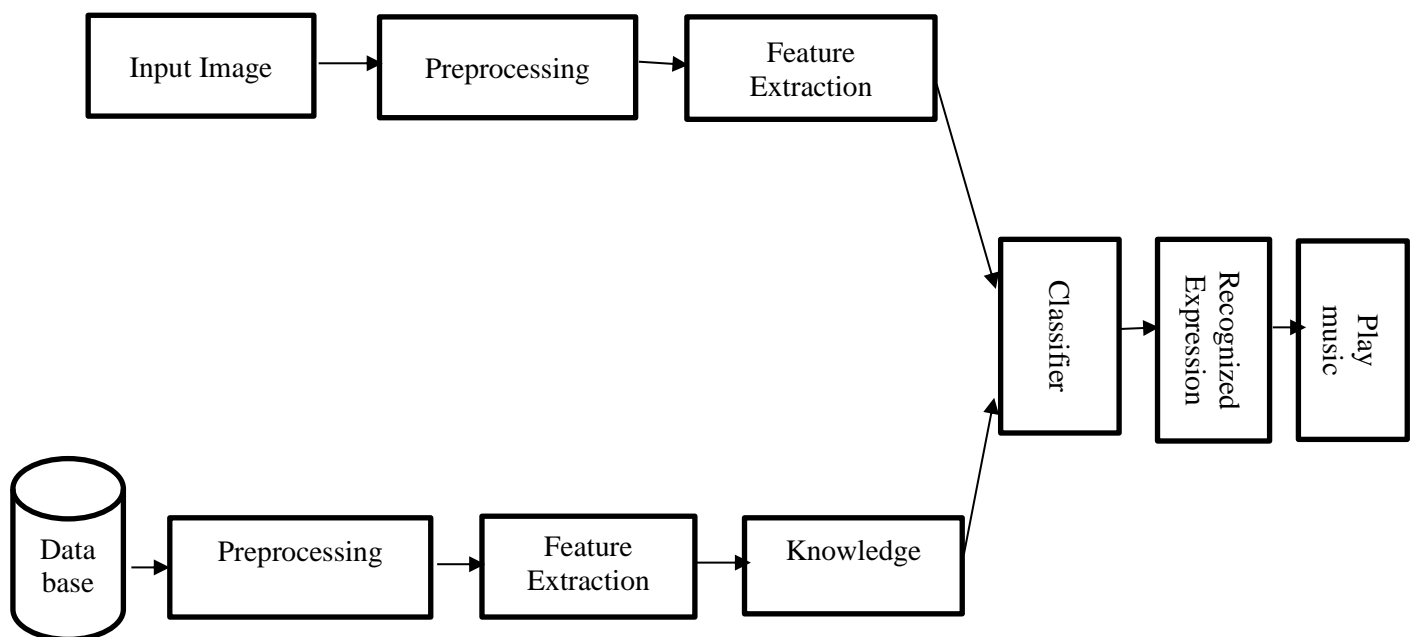

Figure 4.1: System Architecture

2. pre-processing is mainly done to eliminate the unwanted information from the image acquired and fix some values for it, so that the value remains same throughout. In the pre- processing phase, the images are converted from RGB to Grayscale and are resized to 256\*256 pixels. The images considered are in .jpg format, any other formats will not be considered for further processing. During preprocessing, eyes, nose and mouth are the region of interest. It is detected by the cascade object detector which utilizes the Jones-Viola algorithm.

3. Facial Feature Extraction After pre-processing, the next step is featuring extraction.

The extracted facial features are stored as useful information in the form of vectors during training phase and testing phase. The following facial features can be considered “Mouth, forehead, eyes, complexion of skin, cheek and chin dimple, eyebrows, nose and wrinkles on the face”. In this work, eyes, nose, mouth and forehead are considered for feature extraction purpose because these depict the most appealing expressions. With the wrinkles on the forehead or the mouth being opened one can easily recognize that the person is either surprised or is fearful. But with a person’s complexion it can never be depicted. To extract the facial features PCA technique is used.

4. Expression Recognition: To recognize and classify the expressions of a person Euclidean distance classifier is used. It gets the nearest match for the test data from the training data set and hence gives a better match for the current expression detected. Euclidean distance is basically the distance between two points and is given by “(3.1)”. It is calculated from the mean of the eigenfaces of the training dataset. The training images that correspond to various distances from the mean image are labeled with expressions like happy, sad, fear, surprise, anger, disgust and neutral. When the Euclidean distance between the eigenfaces of the test image and mean image matches the distance of the mean image and eigenfaces of the training dataset the expression is classified and named as per the labeled trained images. The smaller the distance value obtained; the closest match will be found. If the distance value is large enough for an image, then the system has to be trained for that individual.

5. Play Music: The last and the most important part of this system is the playing of music based on the current emotion detected of an individual. Once the facial expression of the user is classified, the user’s corresponding emotional state is recognized. Several songs from various domains pertaining to several emotions is collected and put up in the list. Each emotion category has several songs listed in it. When the user’s expression is classified with the help of CNN algorithm, songs.

## 4.2 DATA FLOW (DFD) DIAGRAMS

DFD which shows how the information moves through the system and how it is modified by a series of transformations. It is a graphical technique that shows information and the transformations that are applied as data moves from input to output.

### 4.2.1 DFD Level 0 Diagram

Figure 4.2: DFD Level 0 Diagram

### 4.2.2 DFD Multi Level Diagram

The data flow diagram (DFD) is one of the most important modelling tools. It is used to model the system components. These components are the system process, the data used by the process, an external entity that interacts with the system and the information flows in the system.

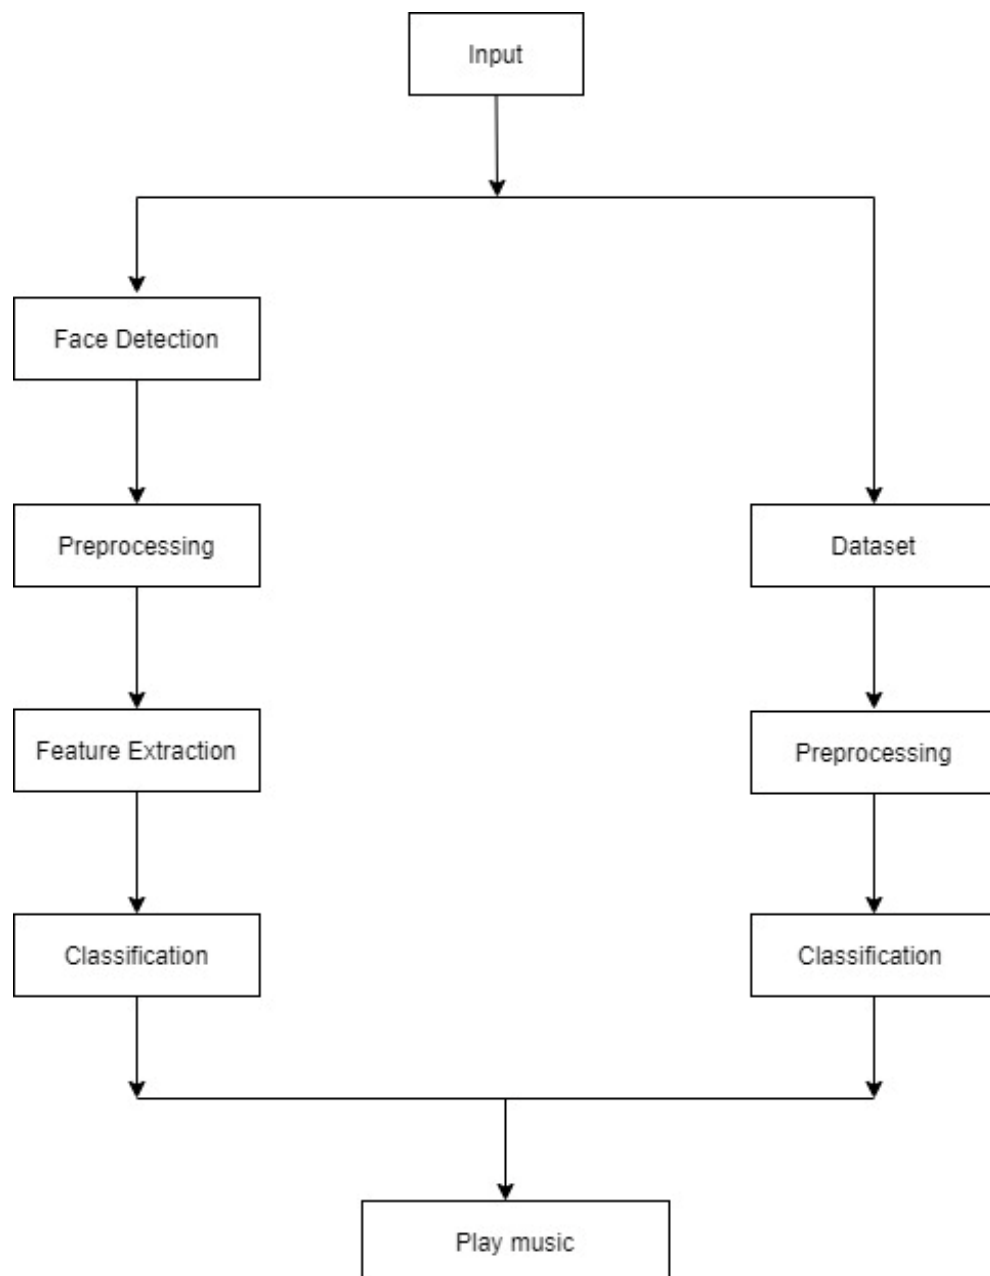

Figure 4.3: DFD Multi Level Diagram

## 4.3 UML DIAGRAMS

### 4.3.1 Activity diagram

Activity diagrams are graphical representations of workflows of step wise activities and actions with support for choice, iteration and concurrency. In the Unified Modeling Language, activity diagrams are intended to model both computational and organizational processes. Activity diagrams show the overall flow of control.

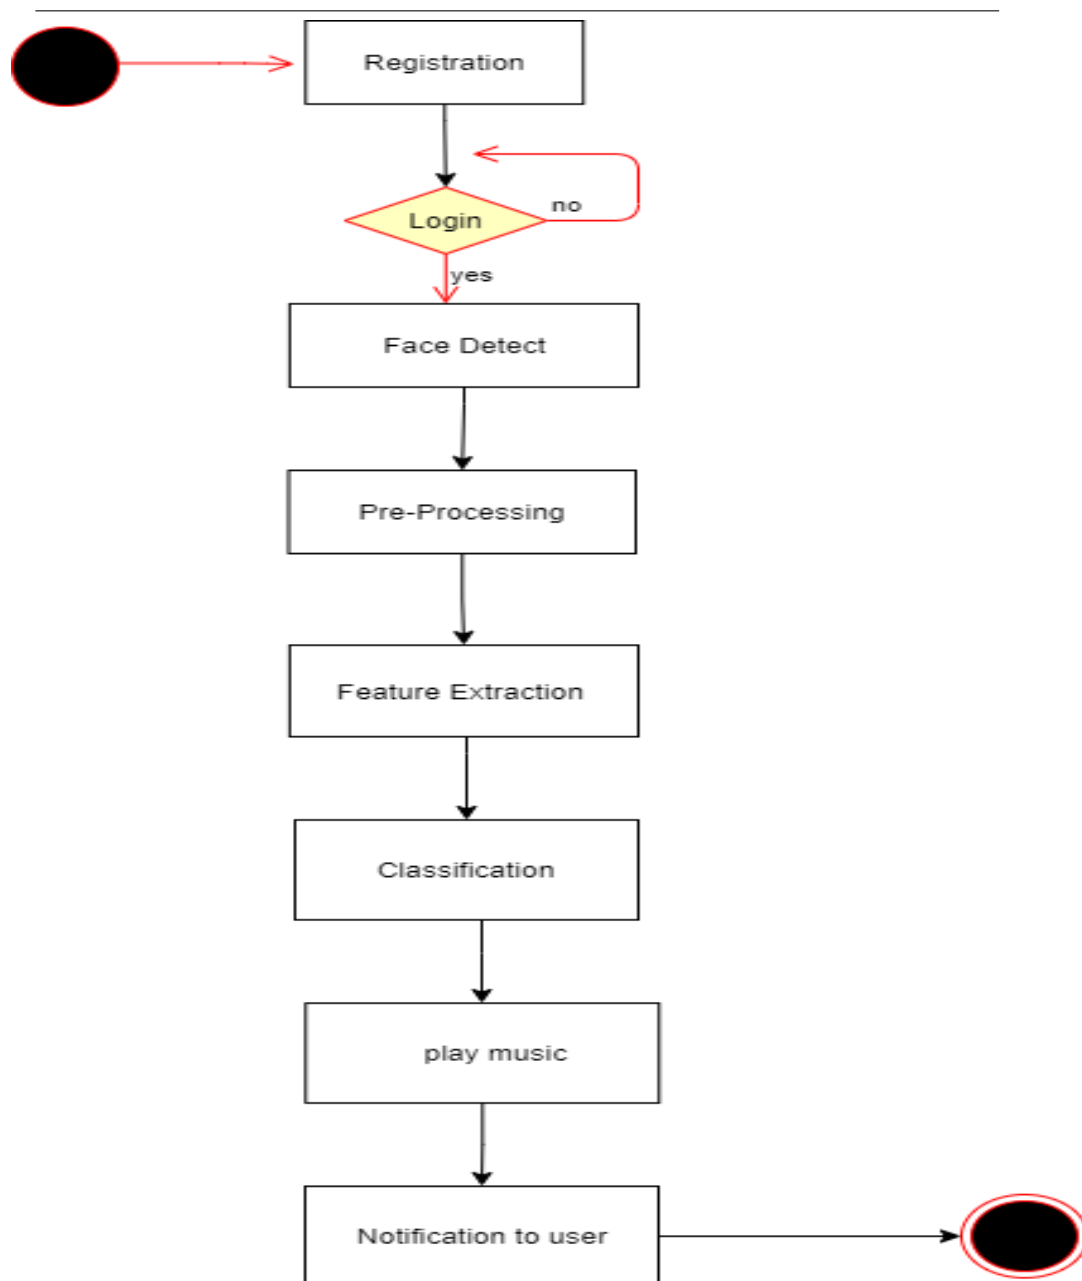

Figure 4.4: Activity Diagram

### 4.3.2 Sequence Diagram

A sequence diagram is a kind of interaction diagram that shows how processes operate with one another and in what order. It is a construct of a message sequence chart. A sequence diagram shows object interactions arranged in time sequence. It depicts the objects and classes involved in the scenario and the sequence of messages exchanged between the objects needed to carry out the functionality of the scenario.

Figure 4.5: Sequence Diagram

### 4.3.3 Use case Diagram.

Generate data from various resources. Provides data from Agri-food transaction module and forward to database. Perform all transactions and generate the final results using block chain.

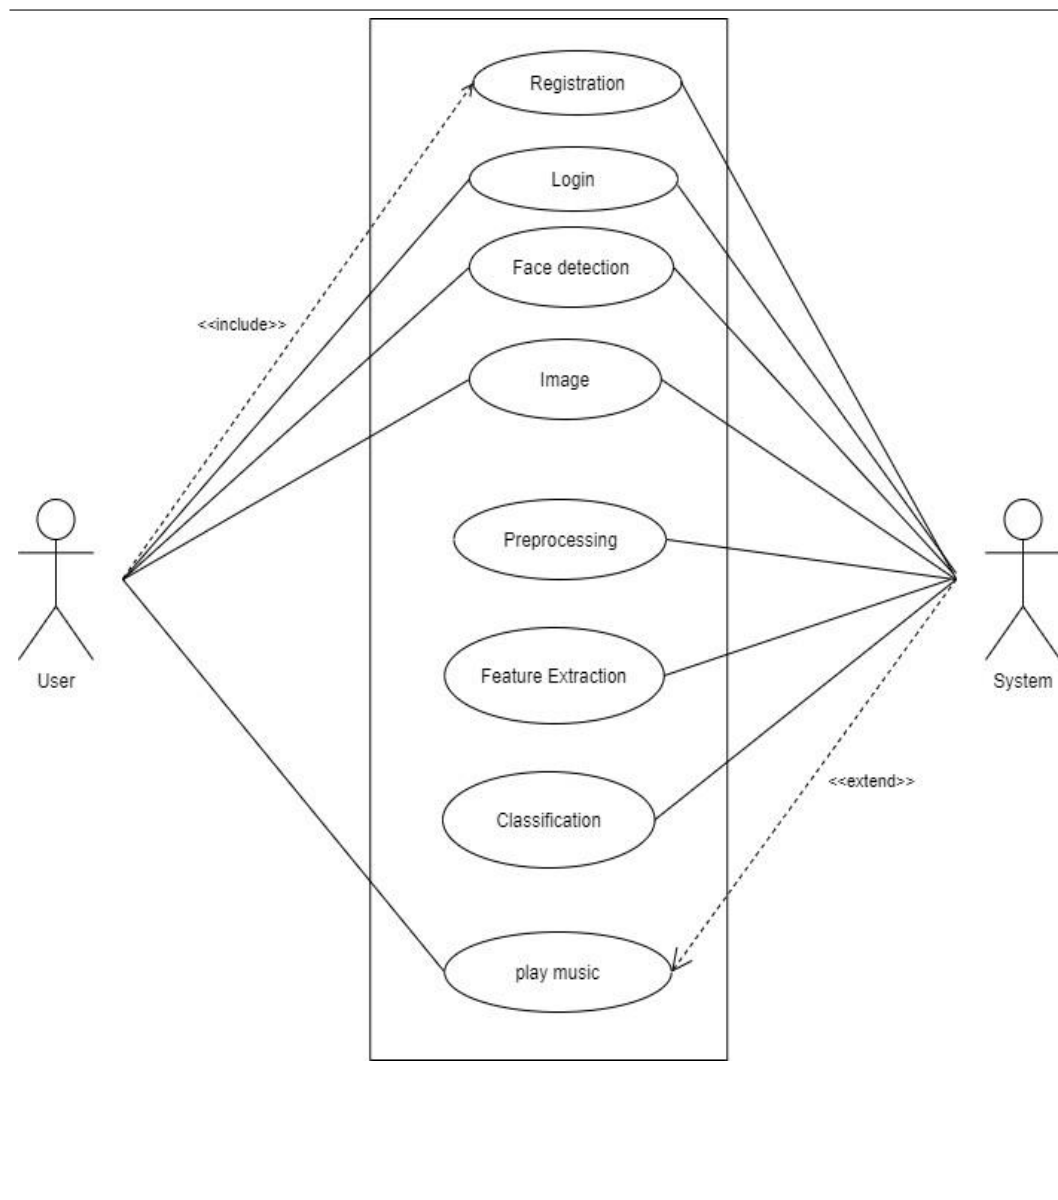

Figure 4.6: Use Case Diagram

#### 4.3.4 Class Diagram

In a class diagram, the classes are arranged in groups that share common characteristics. A class diagram resembles a flowchart in which classes are portrayed as boxes, each box having three rectangles inside. The top rectangle contains the name of the class; the middle rectangle contains the attributes of the class; the lower rectangle contains the methods, also called operations, of the class. Lines, which may have arrows at one or both ends, connect the boxes. These lines define the relationships, also called associations, between the classes.

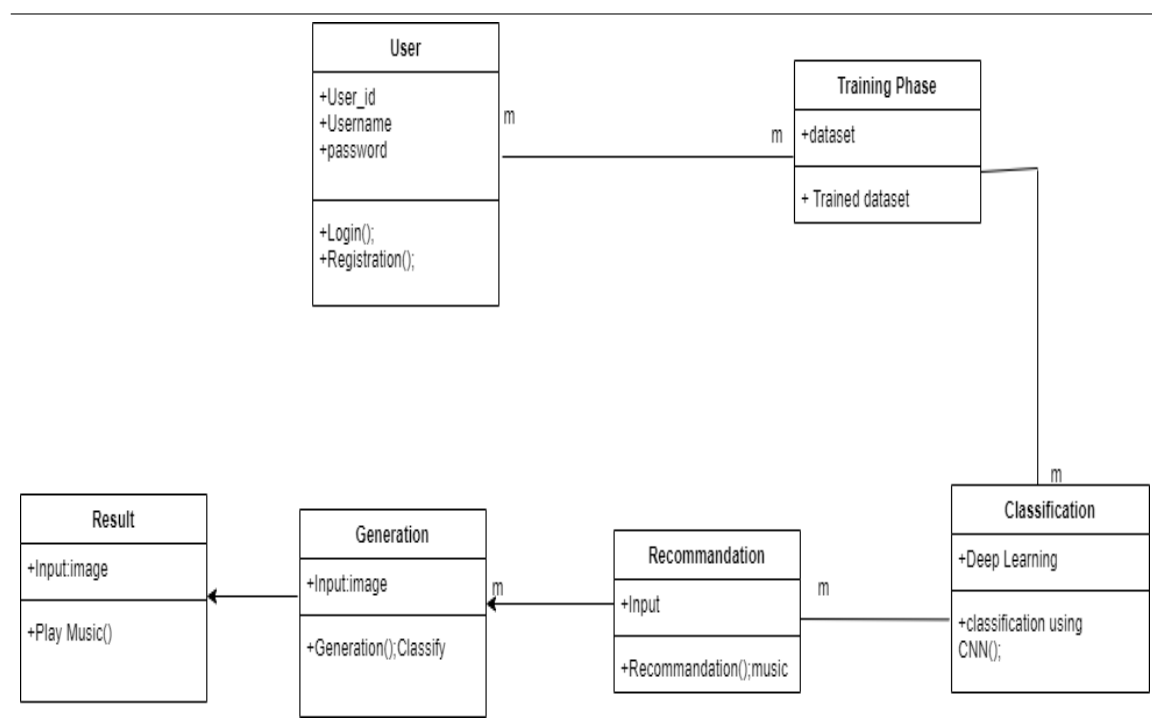

Figure 4.7: Class Diagram

### 4.3.5 ER Diagram

An Entity Relationship (ER) Diagram is a type of flowchart that illustrates how “entities” such as people, objects or concepts relate to each other within a system.

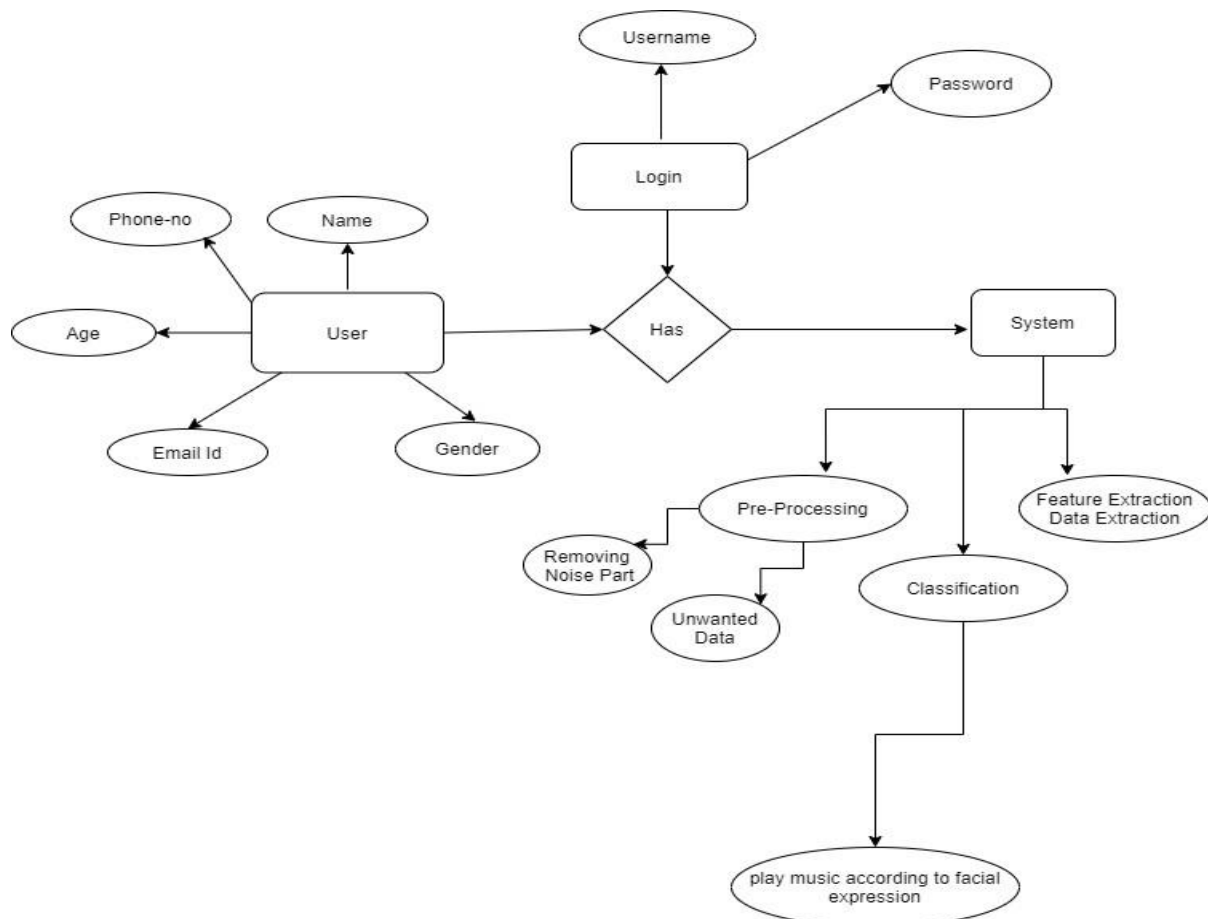

Figure 4.8: Entity Relationship Diagram.

## **CHAPTER 5 SYSTEM IMPLEMENTAION PLAN**

## 5.1 Description of Tools

- Anaconda Navigator
  - Anaconda Navigator is a desktop graphical user interface (GUI) included in Anaconda distribution that allows you to launch applications and easily manage conda packages, environments, and channels without using command-line commands.
  - Navigator can search for packages on Anaconda.org or in a local Anaconda Repository. It is available for Windows, macOS, and Linux.
- Spyder
  - Spyder is short for “Scientific Python Development Environment.” It’s intended for use as a workbench for scientific computing with Python, and that’s reflected in the feature set, the packaging, and the overall behavior of the IDE. Spyder has useful features for general Python development, but unless you work mainly with Python and scientific computing packages, you’re probably better off with a different IDE.
  - The biggest reason not to use Spyder as a general-purpose Python development environment isn’t the feature set, but the setup process. Spyder is not delivered as a standalone executable in the manner of a product like Visual Studio or PyCharm. Instead, it’s installed as a Python package.
- DBSQLite3
  - DB Browser for SQLite (DB4S) is a high quality, visual, open-source tool to create, design, and edit database files compatible with SQLite.
  - DB4S is for users and developers who want to create, search, and edit databases. DB4S uses a familiar spreadsheet-like interface, and complicated SQL commands do not have to be learned.

Controls and wizards are available for users to:

- Create and compact database files.
- Create, define, modify and delete tables.
- Create, define, and delete indexes.
- Browse, edit, add, and delete records.
- Search records
- Import and export records as text.
- Import and export tables from/to CSV files.
- Import and export databases from/to SQL dump files.
- Issue SQL queries and inspect the results.
- Examine a log of all SQL commands issued by the application.
- Plot simple graphs based on table or query data.

## 5.2 Programming Language Description

- Python

Python is an interpreted, object-oriented, high-level programming language with dynamic semantics. Its high-level built in data structures, combined with dynamic typing and dynamic binding, make it very attractive for Rapid Application Development, as well as for use as a scripting or glue language to connect existing components together. Python’s simple, easy to learn syntax emphasizes readability and therefore reduces the cost of program maintenance. Python supports modules and packages, which encourages program modularity and code reuse. The Python interpreter and the extensive standard library are available in source or binary form without charge for all major platforms and can be freely distributed.

## 5.3 Algorithm Details

- CNN Algorithm

A CNN is a kind of network architecture for deep learning algorithms and is specifically used for image recognition and tasks that involve the processing of pixel data. There are other types of neural networks in deep learning, but for identifying and recognizing objects, CNNs are the network architecture of choice.

CNNs are used for image classification and recognition because of their high accuracy. It was proposed by computer scientist Yann LeCun in the late 90s, when he was inspired by the human visual perception of recognizing things.

The widely used algorithms in this context include denoising, region growing, edge detection, etc. Contrast equalization is often performed in image-processing and contrast limited adaptive histogram equalization.

steps:

- Convolutional Layer.
- Pooling Layer.
- Fully Connected Layer.
- Dropout.
- Activation Functions

## **CHAPTER 6 CONCLUSION AND FUTURE SCOPE**

## 6.1 Advantages

- It can capture the user’s emotional state in real-time by analyzing facial express songs.
- This enables the system to recommend music that aligns with the user’s currentmood, making the listening experience more emotionally engaging.
- Facial expression analysis can help create highly personalized music recommendations.
- Users don’t need to manually input their emotional state or preferences, as thesystem can infer this information from their facial expressions.
- Music has the power to influence and regulate emotions.

## 6.2 Limitations

- The accuracy of facial expression recognition technology can vary.
- Facial expressions do not always provide sufficient context for music recommendations.
- A person may smile because they find a song’s lyrics ironic or humorous, whichmay not align with their actual emotional state.

## 6.3 Applications

- Music Streaming Services.
- Mood Regulation.
- Healthcare and Therapy.
- User Experience Enhancement

## 6.4 Conclusion and Future Scope

The proposed work presents a facial expression recognition system to play a song according to the expression detected and classify music Type. It uses CNN approach to extract features, and Euclidean distance classifier classifies these expressions. In this work, real images i.e. user dependent images are captured utilizing the in-built camera.

There are continuously new ways and methods being developed that make use of image processing algorithms to extract the emotion of the user and make use of the extracted emotion to treat the user. Emotion recognition has gained a lot of importance in all aspects of life and if a robust algorithm implemented which can accurately classify the emotions of the person, then a great deal of advancement in the industry can be achieved with the help of this. The system has successfully been able to capture the emotion of a user. It has been tested in a real-time environment for this predicate. However, it has to be tested in different lighting conditions to determine the robustness of the developed system.

### Future Scope

- Reduce the time required to train the classifier.
- Use of EEG signals to make the software even more optimized and to detect the exact mood /emotion of the user

## **APPENDICES**

### 1. Appendix A: Model Architecture

- Provide detailed diagrams, charts, and descriptions of the neural network or machine learning model used for face recognition and music recommendation.

### 2. Appendix B: Hyperparameter

- List the hyperparameters used during training, along with any optimization algorithms and strategies applied to fine-tune the models.

### 3. Appendix C: Evaluation Metrics

- Explain the evaluation metrics used to assess the system's performance and provide the calculations and results for these metrics.

### 4. Appendix D: Model Training Details

- Include information about the hardware and software setup used for training, training time, and any issues or challenges encountered during the training process.

### 5. Appendix E: Results and Performance

- Present the results of experiments and evaluations, including tables, charts, and figures that showcase performance metrics like accuracy, precision, recall, F1 score, and others.
